

LifeOS

Stop managing tasks. Start executing goals.

A personal AI operating system that doesn't just plan your life — it enforces it, on the device, whether you feel like it or not.

Hackathon prototype · Native Android · Working APK

Ever felt like you're procrastinating too much?

Your exam is in three weeks. The interview is a month out. You've been meaning to get fit since January.

So why are you forty minutes into a reels binge, or six tabs deep in a Reddit rabbit hole?

At least, I do.

That's not a market slide. That's my screen time — and probably yours.

THE HONEST VERSION

- I don't need another list.
- I don't need a nicer dashboard.
- I know exactly what I should be doing.
- I need something that will actually stop me.

You don't lack a plan. You lack enforcement.

WHAT EVERY APP GIVES YOU

- Lists, boards, and tags
- Reminders you swipe away
- Streaks you abandon on day four
- A chatbot that writes a perfect plan

WHAT ACTUALLY STOPS YOU

Nothing.

Every one of them is a suggestion. The plan exists, sits there, and Instagram still wins.

People don't fail from disorganization. They fail at **execution** — and execution is the part nobody built.

Nobody who owns your attention will help you escape it.

Google

YouTube watch time is the revenue line. An app that gets you off YouTube is an app that cuts their own numbers.

Meta

Reels engagement is the product. Nothing they ship will ever be designed to make you scroll less.

OS-level Screen Time

Shipped, but deliberately toothless. One tap to dismiss, because friction costs them engagement too.

A third-party OS can be opinionated on purpose. That misalignment is the entire opening — and it isn't closing.

One sentence becomes enforced device state.

YOU SAY

"I have a DSA assignment due Tuesday, I keep doomscrolling Instagram, wake me at 7."

LIFEOS WRITES

- ✓ **Goal** with a hard Tuesday deadline
- ✓ **Tasks + study blocks** on your calendar
- ✓ **Instagram** capped, then blocked
- ✓ **7:00 alarm** armed in the system clock
- ✓ **Memory** "folds to Instagram at night"

It doesn't reply with a checklist. It reaches into the phone and changes it.

Intent → Plan → State → Enforce → Reflect

One model call returns a spoken reply plus typed actions. One component applies them.

The model is the planner. The database is the soul. Exactly one component writes state, so the AI can never corrupt your goals — only propose changes to them.

What LifeOS is meant to be

A single place where planning, deadlines, habits, focus and enforcement live together.

Goal expansion

"Crack Google in a month" becomes tasks, habits, study blocks, caps and alarms.

Schedule & deadlines

Every commitment on one timeline, with a live risk score per deadline.

Mail → calendar

Exams and deadlines pulled out of your inbox and added for you.

Habits & routines

Bedtime and morning nudges, set dynamically from the day you just had.

Focus enforcement

Distracting apps covered by an overlay while a session is live.

Screen time & network

Daily per-app caps, plus on-device DNS blocking that kills the site too.

Alarms that talk

Reminders and wake-ups spoken in your chosen persona's voice.

Evolving personality

It shouts or it's kind — and tunes toward whatever actually moves you.

Plugins

WhatsApp, Moodle, Piazza, any site — auto-ingest what you'd otherwise miss.

It shouts, or it's kind. You choose — then it learns.

Strict

Blunt and terse. Holds you to the deadline. No pep talk, no excuses.

Supportive

Warm and encouraging. Forgives one slip, then gently gets you back.

Coach

Energetic and competitive. Frames the whole week as training.

The persona is the surface. Underneath, it watches how you respond — when you fold, what you ignore, how technical you want the answer, how hard you need to be pushed — and drifts its tone toward what actually gets you working. Same engine, different voice.

Chat forgets. Your life shouldn't.

Every AI wrapper loses your goal the moment its context window is summarized.

EPHEMERAL · COMPACTABLE

- Chat transcript, last 20 turns
- Older turns folded into a summary
- Raw messages deleted
- Tokens are finite — this must happen

DURABLE · NEVER COMPACTED

- ✓ Goals, tasks, events, habits
- ✓ Schedule blocks and alarms
- ✓ App caps and focus rules
- ✓ Memory facts about you

Your goals live in a database the summarizer cannot touch, and get re-injected into every single turn. **Forgetting is a bug we designed out, not a limitation we live with.**

Why call it an operating system?

Today it runs one life on one phone.

One day there will be autonomous agents and robots acting on our behalf. They will need a layer that already knows a person's goals, constraints, habits and priorities — and is trusted to act on them. We're building that layer, and starting where the distraction is.

Retention isn't a streak. It's a result.

When someone actually cracks the interview, or finally loses the 15 kg, with LifeOS pushing them the whole way — the app stops being a tool they use.

It becomes the reason it happened.

Your history is the moat

Weeks of goals, failures, and what actually worked on you. A fresh chatbot starts at zero.

Attached to the outcome

Nobody churns from the thing that got them the offer. The bond is the result, not the UI.

The wedge

Students with a hard deadline this month and a documented distraction problem. High pain, high urgency.

Not a mockup. A working Android app.

Native Kotlin and Jetpack Compose, nine Gradle modules, installable APK on a real device.

9 Gradle modules	110 Kotlin files	26 typed AI actions	6 app screens	15 test suites	1 installable APK
----------------------------	----------------------------	-------------------------------	-------------------------	--------------------------	-----------------------------

MODULE GRAPH

:core models, actions, ports	:domain executor, risk, projection	:agent LLM client, prompts, parser
:email IMAP, classifier	:data durable store, secrets	:enforce focus, alarms, VPN
:calendar device calendar sync	:ui Compose screens	:app wiring, manifest

What's live in the APK

AGENT & MEMORY

- ✓ Chat with three personas
- ✓ One sentence → a whole plan
- ✓ 26 typed actions, tolerant parser
- ✓ Life state survives chat compaction
- ✓ Deterministic deadline risk %
- ✓ Offline fallback if the API dies

ENFORCEMENT

- ✓ Focus overlay via usage-stats polling
- ✓ Back button doesn't lift the block
- ✓ Per-app daily time caps
- ✓ On-device DNS blocking (VpnService)
- ✓ Exact alarms, full-screen + spoken line
- ✓ Survives reboot

INGESTION & SURFACES

- ✓ IMAP fetch + rule-based classifier
- ✓ Promote an email into your schedule
- ✓ Google Calendar via device account
- ✓ Today, Goals, Inbox, Focus, More
- ✓ Encrypted credential storage
- ✓ Permission onboarding flow

Ninety seconds, six beats

- | | | |
|---|-------------------------------------|--|
| 1 | One sentence, twelve changes | A goal is typed. Goals and Today fill in. |
| 2 | It's real device state | Focus on. Leave the app. The overlay slams in front. |
| 3 | Back doesn't save you | The block holds; you land on the home screen. |
| 4 | It kills the site too | DNS blocked on-device — the browser can't reach it either. |
| 5 | It wakes you up | Full-screen alarm, persona line spoken aloud. |
| 6 | It doesn't forget | Compact the chat. Message count drops. Life state doesn't. |

From prototype to product

Now (shipped)

Agent, durable life state, focus overlay, app caps, DNS blocking, alarms, IMAP inbox, calendar sync.

Next few months

Plugin SDK for WhatsApp, Moodle, Piazza and arbitrary sites. Adaptive replanning when you fall behind. Personality that drifts with your history.

Later

Health signals into planning. Opportunity detection. Chief-of-staff mode that finds your deadlines before you do.

Model: free core enforcement, paid personality packs and deep integrations. Focus apps already charge ten dollars a month for a dumb wall — we're charging for an accountability partner you can't otherwise hire.

ChatGPT writes the plan.
LifeOS takes the phone.

Stop managing tasks. Start executing goals.

Working APK, on a real device, right now.
